She has treated many conditions such as heel pain, arch pain, Achilles pain, ankle pain and knee pain. Marie works with some of our current athletes.

## **Frequently Asked Questions:**

### **1. Who should I see when my child has an injury?**

- Whether you have sustained an 'acute injury' (*an injury of sudden onset such as an ankle sprain, back pain, shoulder pain*) or have a 'chronic injury' (*overuse injury such as heel pain, elbow pain, shin pain, long term back pain*), we recommend you see one of the Physiotherapists or Sports Doctors above in the first instance. They are vastly experienced with regards to testing, diagnosis, management (exercise/rest) of musculoskeletal injuries and the sport of gymnastics.

### **2. Can I just take my child to our family Physiotherapist?**

- You are more than welcome to take your child to the Physiotherapist of your choice. However, the coaches at NDGC have developed strong professional relationships with the above listed practitioners. They have treated gymnasts for many years and have a thorough understanding of the sport, the apparatus involved, the skills the athletes perform, the repetitive nature and the differing surfaces within a gymnastics facility. When providing the athletes with rehabilitation programs, the above practitioners can provide detailed information on what skills the athlete should/should not do on each apparatus, the number of landings/impact and rehabilitation exercises which are specific to the injury and gymnastics. The above practitioners are also fantastic at communicating with us and are generally a phone call or email away.

### **3. How long should I wait to see a Physiotherapist or Sports Doctor?**

- If the injury results in modified training (load, intensity, hours) for roughly 3 training days, or affects day to day activities, we recommend getting the injury checked out to get your child back to full training as quickly as possible.

### **4. It has been suggested that my child rests completely from gymnastics to help with the treatment of their injury. Is this the best thing to do?**

- Complete rest from sport is not necessary. For example, an athlete who has sustained an ankle sprain can still do upper body and core exercises. Depending on their gym sport, they may even be able to continue to train on some apparatus. We highly recommend injured athletes still attend training (even if it is for half the session) to perform their rehab, strength and conditioning on the uninjured body parts, train the apparatus they are able to, and also to keep in touch with their teammates and coach. Mental wellbeing and inclusion are very important when an athlete sustains an injury.
